serving as a comprehensive resource that builds a bridge between engineering disciplines and the building sciences and trades forensic engineering damage assessments for residential and commercial structures second edition provides an extensive look into the world of forensic engineering focusing on investigations associated with insurance industry claims the book describes methodologies for performing insurance related investigations including the causation and origin of damage to residential and commercial structures and or unhealthy interior environments and adverse effects on the occupants of these structures edited by an industry expert with more than 40 years of experience and contributors with more than 100 years of experience in the field the book takes the technical aspects of engineering and scientific principles and applies them to real world issues in a nontechnical manner the book provides readers with the experiences investigation methodologies and investigation protocols used in and derived from thousands of forensic engineering investigations features covers 24 topics in forensic engineering based on thousands of actual field investigations provides a proven methodology based on engineering and scientific principles experience and common sense to determine the causes of forensic failures pertaining to residential and commercial properties includes references to many codes standards technical literature and industry best practices illustrates detailed and informative examples utilizing color photographs and figures for industry best practices as well as to identify improper installations combines information from a multitude of resources into one succinct easy to use guide this book details proven methodologies based on over 10 000 field investigations in which the related strategies can be practically applied and appreciated by both professionals and laymen alike

Report of Roof Inspection

1988

this investigation was a limited study of seams in an epdm rubber membrane of the roof of the new wheeled vehicle facility building at aberdeen proving ground maryland the study was initiated at the request of the corps of engineers coe to provide data that could contribute to a data base on the characterization of newly prepared field seams the investigation was beneficial to the national institute of standards and technology nist because it complemented laboratory research on test methods for evaluating seams of vulcanized rubber roof membranes field seam specimens were taken from the roof and analyzed for peel strength and surface condition of the rubber at the time of the inspection the application of the epdm rubber membrane was considered by coe personnel to be proceeding satisfactorily peel tests indicated that the field seams had low bond strengths in comparison to the strengths achieved by cleaned control specimens prepared on the roof using the same procedure and the same adhesive rubber system both the field specimens and cleaned controls for the most part failed cohesively during peel testing unlike the cleaned controls the adhesive layers of the delaminated field seams were found to contain numerous void areas these voids may contribute to low strength of the adhesive layer because they represent areas of little or no bond in addition because the control seams were cured primarily under laboratory conditions a question was raised whether the rates of adhesive cure in the field and laboratory were different scanning electron microscopy sem analysis of uncleaned control specimens and also small areas of the field specimens that failed adhesively during peel testing showed platelet particles typical of the release agent present on the surfaces of both the rubber strip and the corresponding adhesive layer this finding indicated that in these cases some peeling during testing occurred through the layer of release agent on the rubber surface
